

Deployment of VMware Workstation to support courses.

JANET Training have been using VMware workstation to provide hands-on activities using real Operating Systems. This gives delegates an opportunity to test and develop their skills in an authentic but safe environment.

Delegates make use of the VMware Player to configure systems and deploy applications including firewalls like IPCop. They can also download the application and run the activities after the course thus continue their learning experience.

Using VMware to provide authentic activities in technical training courses.

VMware ESX Server to be used in new virtual network.

Located on the backbone of the JANET network, **NetLab** will provide a virtual network made up of ESX servers and industry standard networking hardware.

This will provide delegates with access to a live network that they can use to complete authentic activities, configurations and installations. This will be used in courses covering topics such as multicast, IPv6, security and UK Access Management Federation.

Delegates will gain access to NetLab using a wireless VPN connection from the training venue.
